Product Engineer — AI & Automation

Candidate Job Description

Location: Bengaluru **Experience:** 1–3 years

We’re looking for a **Product Engineer** to work directly with the founder and build AI-native products from 0→1.

This is not a traditional ticket-based engineering role. You’ll take ambiguous problems, figure out what needs to be built, make technical decisions, and ship.

Top 5 skills we're looking for

1. Product Thinking

Turn ambiguous problems into useful products.

2. Ownership & Autonomy

Figure things out and move without waiting for instructions.

3. Full-Stack Engineering

Build across frontend, backend, databases and APIs.

4. AI-Native Development

Comfortable building with LLMs and AI coding tools.

5. Automation & Integrations

APIs, webhooks, n8n and connecting systems.

What you'll work on

• Build products from **0** → **1**
• Work directly with the founder on new ideas and problems
• Build AI-powered workflows and applications
• Integrate APIs, databases and third-party systems
• Prototype quickly and iterate based on feedback
• Make technical and product decisions independently
• Own features from **idea** → **build** → **testing** → **deployment**

We care more about what you've built and how you think than your degree or years of experience.

Good to have

React / Next.js • Node.js / Python • PostgreSQL • LLM APIs • Claude Code / Cursor / similar AI coding tools • n8n • REST APIs • Webhooks • OAuth

> **If you need a detailed specification before you can start, this probably isn't the role for you. If you enjoy figuring out what should be built and then building it, we'd like to meet you.**

Product Engineer — Candidate Test

Test Task & Evaluation Brief

We're intentionally **not giving you a detailed specification**. We want to understand how you think, research, make decisions and build.

Candidate Tasks

1. Company Intelligence

Given a company's website, build a tool that answers: **"What should I know about this company before approaching them for business?"** Use public information and present the output in a useful, structured format.

2. Opportunity Scoring

Given 10–20 companies, answer: **"Which companies deserve my attention first, and why?"** You decide how to score and prioritise them.

3. Find the Right Person

For one selected company, answer: **"Who should I approach and why?"** Identify relevant people/personas and explain your reasoning.

4. Personalised Outreach

Using the company, person and available context, create an appropriate first approach. The output should feel contextual rather than generic AI-generated spam.

5. Automation

Build: **Input** → **Research** → **AI analysis** → **Structured output** → **Database**. You may use any technology or AI tools you find appropriate.

6. Trigger Detection

Given company information from two different points in time, answer: **"What changed, and is anything worth acting on?"** Separate meaningful signals from noise.

7. Data Reliability

If different sources provide conflicting information, decide which information to use, why, and how you would communicate uncertainty.

8. Open-Ended Product Challenge

Build: **"A dashboard that tells me the most important companies I should act on today."** No wireframes or technical specification will be provided. You decide what the product should look like and how it should work.

9. Requirement Change

After completing the above, we'll give you one change: **"I don't want 100 opportunities. I only want the 5 things worth acting on today."** Show us how you would adapt the product.

What we're evaluating

Skill	Weight

Autonomy & Ownership	25%
Product Thinking	20%
Learning / Problem Solving	15%
Full-Stack Engineering	15%
AI-Native Development	10%
Automation / APIs	10%
Communication	5%

Hard filters

No autonomy → No hire.
No product thinking → No hire.
Even if the candidate is an excellent coder.

AI tools are encouraged

Use Claude Code, Cursor, ChatGPT, n8n, documentation, Google, or whatever helps you build. We aren't testing whether you can code without AI. We're testing whether you can use the tools available today to build something genuinely useful.

> **Principle:** We are looking for someone who is junior in experience, but not junior in thinking.
